MENSTRUAL CYCLE PREDICTION SYSTEM

ABSTRACT

The Menstrual Cycle Prediction System is a web-based application developed to assist users in tracking and predicting their menstrual cycles efficiently. The system aims to simplify cycle management by providing accurate predictions based on user inputs. It helps users gain better awareness of their menstrual health and plan accordingly.

The application collects essential information such as the last menstrual date, cycle length, stress level, sleep hours, and exercise level. These factors play a significant role in influencing the menstrual cycle. By considering both biological and lifestyle factors, the system ensures a more realistic prediction approach compared to traditional tracking methods.

Overall, the Menstrual Cycle Prediction System demonstrates how web technologies can be effectively used to address real-life health challenges. The system is easy to use, cost-effective, and does not require complex infrastructure. Future enhancements may include integration of machine learning techniques, data storage, and mobile application development to further improve accuracy and usability.
